

### Surface damage to the eye

Where the eye surface has been corroded by chemicals or attacked in some way, seek professional medical attention immediately and at any time of day. Rinse the eye straight away and during transportation to the treatment center. The eyes must be actively kept open to ensure efficient flushing. **Rinsing should be carried out for as long as possible, or at least 30 minutes** and continuously until the patient can be seen by an eye care professional.

**Your Eyes– Our focus**

There should be sufficient eye wash bottles available at the workplace, depending on the nature of the work and working conditions, so that foreign objects, chemicals and other irritants can be removed quickly.

If your eyes come into contact with chemicals or other foreign objects they should be rinsed for as long as possible, or at least for 30 minutes.

Numbers of eye wash bottles required for 30 minutes of eye rinsing.

Combined weight needed to achieve 30 minutes of eye rinsing including, among other things, transport to treatment center.

100% one-handed operation		•						
Continuous pressure for up to 15 minutes per bottle, regardless of the spraying angle		•						•
One-handed activation		•		•				•
First aid treatment may be applied to both eyes simultaneously		•			•	•		
Ability to administer first aid with gloves on		•						
No contact with eyes using 'dirty' fingers		•			•	•		
Eyes can be washed face down. Gravity naturally helps to rid the eye of foreign objects and other irritants, while 'contaminated' rinse fluid does not come into contact with the person, skin or clothing		•						
Eyes automatically kept open in order to ensure effective rinsing behind the eye		•						

The extent of damage will depend on the type, amount and concentration of chemicals and other irritants affecting the eye, as well as the time that has elapsed before any rinsing has begun.
